AIUB COURSE SOLUTION

Lab Lecture -2 : IP Addressing II

Classful Addressing :

IP Address have 5 classes -

	<u>Class</u>	<u>Binary Notation : 1st Octet</u>	
Configuring Devices	A ----- 0	[1st bit]	
	B ----- 10	[1st 2-bit]	
	C ----- 110	[1st 3-bit]	
Multicast Purpose	D ----- 1110	[1st 4-bit]	
Reserved for Research Purpose	E ----- 1111	[1st 4-bit]	

Recognizing Class :

	<u>Class</u>	<u>Decimal Notation : 1st Byte</u>	
	A ----- 0	0 - 127	
	B ----- 10	128 - 191	
	C ----- 110	192 - 223	
	D ----- 1110	224 - 239	
	E ----- 1111	240 - ...	

AIUB COURSE SOLUTION

Address Space :

Class A $\rightarrow 2^{31}$ $\rightarrow 50\%$

Class B $\rightarrow 2^{30}$ $\rightarrow 25\%$

Class C $\rightarrow 2^{29}$ $\rightarrow 12.5\%$

Class D $\rightarrow 2^{28}$ $\rightarrow 6.25\%$

Class E $\rightarrow 2^{28}$ $\rightarrow 6.25\%$

Special Purpose IP Address :

0.0.0.0 \rightarrow DHCP discovery message (Dynamic Host Configuration Protocol)

255.255.255.255 \rightarrow Limited Broadcast

Relationship :

Unicast : One to One

Example - Class A \rightarrow D or, Class C \rightarrow E

Multicast : One to Many

Example - Class A \rightarrow D, C

Broadcast : One to All

Example - Class A \rightarrow B, C, D, E

AIUB COURSE SOLUTION

Network Address and Host Address :

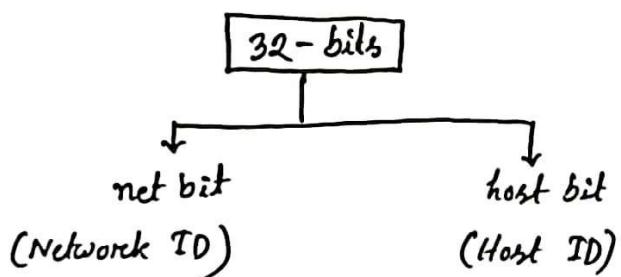

Network ID: Identifies the network on which a host computer can be found.

Host ID: Identifies a specific device on the network indicated by the network ID.

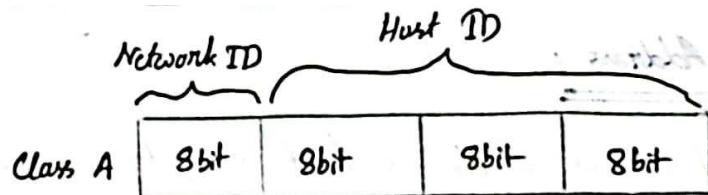

* First and Last IP of a network cannot be used to configure a device.

- # i) Network IP → First IP of a network
- ii) Host IP → Middle IP of a network
- iii) Broadcast IP → Last IP of a network

32-bits are divided into two groups.

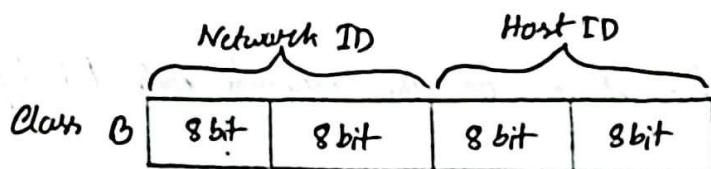

AIUB COURSE SOLUTION

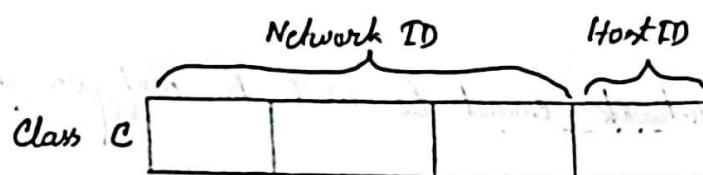

Network ID: 8 bits

Host ID: 24 bits

Network ID: 16 bits

Host ID: 16 bits

Network ID: 24 bits

Host ID: 8 bits

Address space available = 2²⁴ = 16,777,216
Addressable space = 2²³ = 8,388,608
Broadcast address = 2²⁴ - 1 = 16,777,215

Address range = 192.168.1.1 to 192.168.1.8388608

Host 1

Host 2

Host 3

Host 4

(192.168.1.2 - 192.168.1.254) Addressable range

(192.168.1.1 - 192.168.1.1) Broadcast range

AIUB COURSE SOLUTION

Lab Lecture - 2 : IP Addressing II (contd.)

Lab-2

30 May, 2022

⇒ First 2-bit 10 represent private IP address

⇒ First octet 172 use Second octet 16-31 represent private IP addresses.

Network Address and Host Address:

$$\text{* Number of Networks} = 2^{\text{number of network bits}}$$

$$\text{* Number of Valid Hosts} = 2^{\text{number of host bits}} - 2$$

$$\text{* Number of IP Addresses in the Network} = 2^{\text{number of host bits}}$$

⇒ More net bits → More devices in network

⇒ More host bits → More IP addresses.

1. Find the number of networks, valid hosts and IP addresses for 192.6.2.0

Ans: Given that,

192.6.2.0

Here, first octet is 192. So, it belongs to class C. So, the number of net bits are 24 and host bits are 8.

$$\therefore \text{Number of Networks} = 2^{\text{number of network bits}} = 2^{24} = 16777216$$

$$\therefore \text{Number of Valid Hosts} = 2^{\text{number of host bits}} - 2 = 2^8 - 2 = 254$$

$$\therefore \text{Number of IP addresses} = 2^{\text{number of host bits}} = 256$$

Scanned with CamScanner

AIUB COURSE SOLUTION

IP Addresses are 2 types - i) Classful
ii) Classless

i) Classful: net bit and host bits তের ক্লাস এবং | Example -

130.6.140.35

ii) Classless: slash (/) প্রিফি লেন্থ ক্লাসে নাই, এবং ১৮৫
number of net bits. Example -

130.6.140.35/18

সুন্দর, Number of net bits = 18

∴ Number of host bits = $32 - 18 = 14$

∴ Number of IP addresses = $2^{14} = 16384$

Extracting Information in a Block :

To find Network IP Address :

Step-1: Convert IP into binary.

Step-2: Make all host bits 0.

Step-3: Convert the binary to decimal again

To find Broadcast IP Address :

Step-1: Convert IP address into binary

Step-2: Make all host bits 1.

Step-3: Convert the binary to decimal number again.

Scanned with CamScanner

AIUB COURSE SOLUTION

Example: Find Network IP address and Broadcast IP address for 130.6.190.35/14.

Ans: Given that,

130.6.190.35/14

Here, net bits = 14

$$\therefore \text{host bits} = 32 - 14 = 18$$

⇒ Converting IP address into binary,

10000010.00000110.10111110.00100011
130 6 190 35
net bits host bits

⇒ For finding Network IP, making all host bits 0.

∴ 10000010.00000100.00000000.00000000

⇒ 130.4.0.0

So, the network IP is 130.4.0.0

⇒ For finding Broadcast IP, making all host bits 1.

∴ 10000010.00000111.11111111.11111111

⇒ 130.7.255.255

So, the broadcast IP is 130.7.255.255

(Ans)

Scanned with CamScanner

AIUB COURSE SOLUTION

Broadcast:

Broadcast: Sending packets to all hosts of a network. Broadcast is

2 types:-

- i) Limited Broadcast
- ii) Direct Broadcast

i) Limited Broadcast: When a host of a network sends packet to all hosts of the same network.

Source IP	Destination IP	Data
5.6.1.2	255.255.255.255	packet

ii) Direct Broadcast: When a host of ~~the~~ a network sends packet to all hosts of another network.

Source IP	Destination IP	Data
192.3.0.1/24	192.3.0.255/24	
192.3.0.1/16	192.3.255.255/16	packet

[Last octet - 255] [First three octets - 192.3.0]

Network Mask / Subnet Mask:

Step-1: Make all net bits 1

Step-2: Make all host bit 0.

Scanned with CamScanner

AIUB COURSE SOLUTION

Network Mask: It's applied on classful addressing.

Example -

Class A → 11111111. 00000000 . 00000000 . 00000000 or
 255.0.0.0

Class B \rightarrow 11111111.11111111.00000000.00000000 or
255.255.0.0

Class C → 11111111 · 11111111 · 11111111 · 00000000 or
255.255 · 255.0

Subnet Masking: It's applied on classless addressing.

Example -

Given that,

192.100.12.110 / 22

Here, net hits = 22

$$\therefore \text{host bits} = 32 - 22 = 10$$

Converting IP address into binary,

11000000 . 011100100 . 00001100 . 01101101

Making all net bids 1 and host bids 0.

11111111 · 11111111 · 11111100 · 00000000

⇒ 255. 255. 252. 0

So, after subnet masking the IP address is 255.255.252.0
(Ans)
